

Artificial Intelligence (AI)

1. Introduction

[illegible]

learning, reasoning, perception, language understanding, and decision-making. Artificial Intelligence (AI) is the field of computer science focused on creating systems that can perform tasks requiring human intelligence. These include learning, reasoning, perception, language understanding, and decision-making. Artificial Intelligence (AI) is the field of computer science focused on creating systems that can perform tasks requiring human intelligence. These include learning, reasoning, perception, language understanding, and decision-making. Artificial Intelligence (AI) is the field of computer science focused on creating systems that can perform tasks requiring human intelligence. These include learning, reasoning, perception, language understanding, and decision-making.

2. History

[illegible]

3. Types of AI

[illegible]

4. Machine Learning

[illegible]

5. Deep Learning

[illegible]

6. Neural Networks

[illegible]

7. Supervised Learning

[illegible]

8. Unsupervised Learning

[illegible]

9. Reinforcement Learning

[illegible]

10. Natural Language Processing

[illegible]

11. Computer Vision

[illegible]

12. Robotics

[illegible]

13. Expert Systems

[illegible]

14. AI Applications

[illegible]

15. Advantages

[illegible]

16. Challenges

[illegible]

17. Ethics

[illegible]

18. Future

[illegible]

19. Careers

[illegible]

20. Conclusion
